

In the Specification:

A² [0032] Typically, solvents are used in amounts such that the weight ratio of benzylic starting compound to solvent is in the range of from about 0.2 to about 1.5 grams of benzylic starting compound per gram of solvent. A weight ratio of from about 0.8 to about 1.0 grams ~~moles~~ of benzylic compound per gram ~~mole~~ of solvent is more preferable.
